                                                                                        RESULT 7
                                                                                                                                                            닭
                                                                                                                                                                                                                                                                                                                                                                             CC promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypoptide from a CC microbial source. The invention also relates to a transformed plant CC comprising the recombinant DNA construct and a method of producing a transformed plant CC such as maize or soybean. The method of producing a transformed plant CC having an improved property comprises transforming a plant with the CC recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties. CC The recombinant DNA construct is useful for producing plants with the collerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, introgen or posts, improved plant growth plant growth rate by modification of the cell cycle pathway with plant growth regulators, introgen or content, improved plant growth and development under at least one stress condition, improved plant growth and development under at least one stress condition. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence half of patent did not format from USPFO at sequence soots obtained in electronic compared to the printed specification but was obtained in electronic compared to the printed specification but was obtained in electronic compared to the printed specification but was obtained in electronic compared to the printed specification but was obtained in electronic compared to the printed specification but was obtained in electronic compared to the printed specification but was obtained in electronic compared to the printed specification but was obtained in electronic compared to the printed specification but was obtained in electronic compared to the compared to the printed specification but was obtained in electronic compared to the compared to the compared to

                                                                                                                                                                                                                                                                                                                                                                   Mehraban F,
Smithson G,
The invention relates to a new isolated polypeptide comprising an amino acid sequence selected from 17 fully defined human NOVX sequences (even SEQ ID NOS between ADG39770 and ADG39802), a mature form of the NOVX amino acid or a variant of NOVX, where one or more amino acid residue in the variant differs in no more than 15% of the amino acid residues of NOVX. Also included are an isolated nucleic acid (NA) molecule (comprising a nucleic acid sequence encoding a NOVX polypeptide above odd SEQ ID NOS between ADG39769 and ADG39801), a nucleic acid fragment encoding at least a portion of a NOVX polypeptide and a complement of NOVX NA), a vector comprising NOVX NA, a cell comprising the vector, an antibody that immunospecifically binds to NOVX, a method for determining the presence or amount of NOVX or NOVX NA in a sample, a method of identifying an agent that binds to NOVX, a method for identifying an
                                                                                                                                                                                                                                                       treating e.g. cardiomyopathy, atherosclerosis, obesity, prostate cancer, AIDS, bronchial asthmultiple sclerosis.
                                                                                                                                                                                                                                                                     New NOVX polypeptides and nucleic acids, useful for diagnosing or treating e.g. cardiomyopathy, atherosclerosis, hypertension, scleroderma,

                                                                                                                                                                                                                                                                                                                                                in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies egainst it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The
                                                                                                                                                 Sequence 178
                                                                                                                                                                              involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mepping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (FCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 20; SEQ ID NO 50796; 103pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        31-MAR-2000; 2000US-00540217.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to new Proteus mirabilis polypeptides and polymucleotides. The invention also relates to antibodies against the polypeptides, methods for producing the polypeptides, anethod of generating vaccines for immunising an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polymucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drugs or as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New Proteus mirabilis polypeptides and polynucleotides, useful reagents for diagnosis of bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, or

The novel nucleotide-binding zinc CC finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches can be used to regulate the expression of oncogenes such as erbb-2. CC may be used to regulate the expression of oncogenes such as erbb-2. CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat CC viral infections by inhibiting the synthesis of viral gene products. They can be used in producing functional gene knockout or activation in CC heterozygous transgenic animals. Proteins of the invention can CC is manifested in a >100-fold decrease in affinity for the variant CC sequence. Gene activation and repression can be achieved by targetting within the gene transcript, suggesting that information obtained from CC expressed sequences tags may be useful can be achieved by targetting CC switches. Sequences AAB02876-B02869 represent zinc finger alpha helix CC phage library peptides disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

Regulating expression of nucleotide sequence that contains sequence (GNN)n-3', comprises exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      achieved through specific contacts from side chains of amino acid residues in the alpha helix. Each zinc finger can recognise a subsite of the state of the state
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                16-OCT-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an expression of nucleotide sequence that contains sequence 5' (GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5' (GNN)n-3'. The present
                                                                                                                                                           The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expres gene expression enhancement.
                                                                                                             Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 7

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for regulating gene function.

Disclosure; Fig 1; 48pp; English.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences ABB02860-B02875. Sequences ABB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                seq length: 0

The nucleic acid molecule may also be used for the manufacture of functional ribonucleic acids, such as ribozymes, antisense nucleic acids and siRNA, ADR83733-ADR84189 represent S. pyogenes hyperimmune serum reactive antigens, fragments and the encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This invention describes a novel nucleic acid molecule encoding a hyperimmune serum reactive antigen or its fragment from Streptococcus pyogenes. The nucleic acid molecule or hyperimmune serum-reactive antigen or its fragment are useful for the manufacture of a pharmaceutical or its fragment are useful for the manufacture of a pharmaceutical preparation, especially a vaccine, against S. pyogenes infection. In addition, the hyperimmune serum reactive antigen or fragment is used for the isolation and/or purification and/or identification of an interaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated nucleic acid molecules encoding hyperimmune serum-reactive antigens from Streptococcus pyogenes, useful for diagnosing, preventing and treating S. pyogenes infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 WPI; 2004-653698/63.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention comprises the amino acid sequence of proteins from the hyperthermophile Methanopyrus kandleri, the invention also comprises the complete genome from Methanopyrus kandleri. The Methanopyrus kandleri proteins of the invention are useful for enhancing the stability and/or activity of other proteins. The Methanopyrus kandleri genome is useful i a variety of diagnostic and analytical methods. The present amino acid sequence represents a Methanopyrus kandleri protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acids encoding any of about 1700 Methanopyrus kandleri proteins, and the encoded proteins, useful as a medicaments as diagnostic agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  04-MAR-2002; 2002US-0361742P

                                                                                                                                                                                 GBB36 is useful as a vaccine for vaccinating an animal, preferably a human against infection by a bacterial organism such as a streptococcal or staphylococcal bacteria, and for treating a disease caused by group A streptococci, group B streptococci or Staphylococcus aureus in an animal preferably a human. Vaccines and antibodies against the proteins of the invention are useful in prophylaxis and/or treatment of diseases such as necrotising fasciitis, scarlet fever, sepsis, impetigo, bacterial meningitis, otitis media, community-acquired pneumonia and many diseases of newborns. The proteins are also used as immunogens to stimulate the production of antibodies for use in passive immunotherapy, for use as diagnostic reagents and for use as reagents in other processes such as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polypeptides obtained from group A or B streptococci , especially Staphylococcus aureus homologous to Sp36 protein of Streptococcus pneumoniae useful as antibacterial vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Group A streptococci protein 36(2); GAS36(2); immunogen; vaccine; antibody; necrotising fasciitis; scarlet fever; sepsis; impetigo; bacterial meningitis; otitis media; community-acquired pneumonia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Streptococcus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ś
                                                                                                                                                                                                        CC Streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus Bayogenes), comprising one of 5483 sequences (S1), given in CC the specification. The proteins have antibacterial and antiinflammatory CC activity. (I), nucleic acids encoding (I), ABN66044-ABN71556 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

CC Nucleic acids encoding (I) are used to detect Streptococcus in a composition comprising (I) or a nucleic acid encoding (II), may be used to detect acid encoding (II), may be used as a vaccine or diagnostic composition. The disease caused by CC Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity correcting appreciation and distinguishing/identifying corrections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         RESULT 5

CC For example, a Synthetic polydactyl protein containing six zinc filiger CC domains can recognise an 18 by sequence, and such proteins are petentially highly gene-specific. The novel nucleotide-binding zinc CC finger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of oncogenes such as erbb-2. CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also be used to activate genes involved in fighting diseases, and to treat CC viral infections by inhibiting the synthesis of viral gene products. They can be used in DNA-based diagnostic applications. The proteins may also be used in producing functional gene knockout or activation in CC discriminate between sequences which have a single base difference. This cis manifested in a >100-fold decrease in affinity for the variant CC sequence. Gene activation and repression can be achieved by targetting CC within the gene transcript, suggesting that information obtained from CC switches. Sequences Alabo2876-B02889 represent zinc finger alpha helix cc phage library peptides disclosed in the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                achieved through specific contacts from side chains of amino acid residues in the alpha hellx. Each zinc finger can recognise a subsite 3 bp in target DNA. Covalent linkage of multiple zinc finger domains allows the recognition of extended contiguous asymmetric DNA sequence

Zinc finger binding 12-FEB-2004 (first entry) region #33

finger-nucleotide binding polypeptide; expression regulation; finger binding region.

Synthetic.

US6610512-B1

26-AUG-2003

28-JAN-2000; 2000US-00494190

16-OCT-1998; 14-OCT-1999; 98US-00173941. 99WO-EP007742.

SCRIPPS

WPI; 2003-800134/75

Regulating expression of nucleotide sequence that contains sequence (GNN)n-3', comprises exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to an expression of nucleotide sequence that contains sequence 5-(GNN)n-3', in which n is 1-6, is regulated by exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypeptide that contains a nucleotide binding region having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present
                                                                                                                                                                             The invention comprises a library of multimeric DNA binding polype (e.g. zinc finger DNA binding polypeptides). The zinc finger bindi polypeptides of the invention are useful for sterically occluding binding site of a natural transcription factor and enhancing or st target gene expression. The present amino acid sequence represents finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expression gene expression enhancement.
                                                                                                                        Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               nucleotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                                                                                                                                                                                                                                       Disclosure; Fig 20; 64pp; English.

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for

                                                                                                                                                                                The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined in the specification. The foetal polypucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporosis), thrombolytic disorders, nervous system disorders and inflammation. The present sequence is a polypeptide encoded by a CDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue CDNA libraries
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; foetal protein; cytostatic; immunosuppressive; immunostimulant; nootropic; neuroprotective; thrombolytic; osteopathic; antiinflammator; gene therapy; antisense therapy; cancer; immune disorder; growth disorder; osteoporosis; thrombolytic disorder; nervous system disorder; inflammation.
                                                                                                                                                                                                                                                                                                             Novel fetal proteins useful for the treatment and diagnosis of diseases associated with dysfunction of the protein e.g. cancers, immune disorders, growth disorders, thrombolytic disorders, nervous system disorders and inflammation.

                                                                                                                                                                                                                                                                                                                                       The invention relates to novel foetal polypeptides encoded by polynucleotides comprising one of 477 sequences fully defined in the specification. The foetal polynucleotides and polypeptides are useful in the treatment and diagnosis of diseases such as cancers, immune disorders, growth disorders (e.g. osteoporoais), thrombolytic disorders, polypeptide growth disorders and inflammation. The present sequence is a polypeptide encoded by a CDNA assembled using an expressed sequence tag (EST) found to be expressed in human foetal tissue CDNA libraries

CC specific for P. acnes protesins. The sequence das describing the expression and activity of P. acnes polypeptides and CC specific for P. acnes fine antibodies and because of E. acnes in the protesins of the invention CC specific for P. acnes protesins. These antibodies and CC specific for P. acnes protesins. These antibodies and CC diagnostic agents that binds to the protesins of the invention CC specific for P. acnes protesins. These antibodies and CC diagnostic agents for determining P. acnes polypeptides and CC diagnostic agents for determining P. acnes polypeptides and CC diagnostic agents for determining P. acnes presence, for example, by cc enzyme linked immunosorbent assay (ELISA). Note: The sequence data for CC obtained in electronic format directly from WIPO at CC obtained in electronic format directly from WIPO at CC obtained in electronic format directly from WIPO at CC obtained in published pot_sequences

The invention also relates to CC immunogenic fragments of P. acres polypeptides. The invention also relates to CC additionally encompasses expression vectors and host cells comprising a polypeptide of the invention; antibodies against polypeptides of the invention; antibodies apainst polypeptides of the comprising a polypeptide of the invention; a come to comprising a polypeptide of the invention; a come to comprising a polypeptide of the invention; a come to comprising polypeptides of the invention; a come to comprising polypeptides, comprising polypeptides, comprising polypeptides, comprising polypeptides, antibodies, antibodies, comparising polypeptides, or composition; a come of comparising polypeptides, or comparison polypeptides, antibodies, fusion proteins, and a method for inhibiting the development of P. acres in a comparison polypeptides, polymucleotides, antibodies, fusion proteins, and a come polypeptides are useful for datagnosing, preventing cells that express the complexity polymucleotides can also be used as probes or primers for concletion. The polymucleotides can also be used as probes or primers for concletion of an immune response specific for a P. acres concent of the kit is useful for performing a diagnostic assay. The present convention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly for comparison proteins. The polymucleotides of the concent part of the present of the present of the protein part of the concent part of the protein part
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to an isolated polynucleotide (ACF64435-ACF64733) encoding a Propionibacterium acnes protein. The invention also relates polypeptides encoded by the polynucleotides (ABM35624-ABM64536) and to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New Propionibacterium acnes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acne vulgaris, or for stimulating an immune response specific for a P. acnes protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Mitcham JL, Skeiky YAW, Pers

CC for example, a synthetic polydactyl protein containing six zinc finger CC domains can recognise an 18 bp sequence, and such proteins are CC domains can recognise an 18 bp sequence, and such proteins are CC domains can recognise an 18 bp sequence, and such proteins are CC dinger proteins may therefore be used in the development of artificial CC gene-specific transcriptional regulators. Such transcriptional switches CC may be used to regulate the expression of conceases such as erb8-2, CC overexpression of which is involved in malignant transformation. The CC proteins are therefore useful in the treatment of cancers, and may also CC wiral infections by inhibiting the synthesis of viral gene products. They can be used in DNA-based disgnostic applications. The proteins may also CC may be used in producing functional gene knockout or activation in CC discriminate between sequences which have a single base difference. This is manifested in a >100-fold decrease in affinity for the variant CC within the gene transcript, suggesting that information obtained from CC expressed sequence tags may be sufficient for the construction of gene CC switches. Sequences AAB02876-B02869 represent zinc finger alpha helix construction of gene CC phage library peptides disclosed in the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      achieved through specific contacts from side chains of amino acid residues in the alpha helix. Each zinc finger can recognise a subsite 3 bp in target DNA. Covalent linkage of multiple zinc finger domains 3 lows the recognition of extended contiguous asymmetric DNA sequences

                                                                                            The invention comprises a library of multimeric DNA binding polypeptides (e.g. zinc finger DNA binding polypeptides). The zinc finger binding polypeptides of the invention are useful for sterically occluding the binding site of a natural transcription factor and enhancing or silencing target gene expression. The present amino acid sequence represents a zinc finger DNA binding peptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 7
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              exposing nucleotide sequence to composition comprising isolated and purified zinc finger-nucleotide binding polypoptide that contains a nucleotide binding gregion having a sequence of Gly-Cys-Arg-Glu-Leu-Val-Arg. The invention is used in the regulation of the expression of the invention is used in the regulation of the expression of the nucleotide sequence that contains sequence 5' (GNN)n-3'. The present
                                                                   Sequence 7
                                                                                                                                                                                                                                               New zinc finger library of multimeric DNA binding polypeptides, useful for sterically occluding the binding site of a natural transcription factor, and enhancing or silencing target gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    gene expression enhancement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 library; multimeric DNA binding polypeptide; zinc finger DNA binding peptide; gene expression silencing;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucreotide sequence that contains sequence 5'-(GNN)n-3'. The present sequence represents the amino acid sequence of a zinc finger binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to an expression of nucleotide sequence that contains sequence 5'-(GNN)n-3', in which n is 1-6, is regulated by
                                                                                                                                                                                                                 Disclosure; Fig

Description

The invention relates to zinc finger nucleotide-binding proteins which comprise 2-12, preferably 2-6, operatively linked motifs selected from sequences AAB02860-B02875. Sequences AAB02860-B02875 represent the alpha helical regions of zinc finger domains which specifically bind to target nucleotide triplets of the sequence 5'-GNN-3'. Such regions may be linked by the peptide linker TGEKP (AAB02970). The Cys2-His2 zinc finger motif is the most frequently utilised nucleic acid binding motif in eukaryotes, and constitutes a beta-beta-alpha fold. Nucleic acid recognition is

Novel isolated and purified zinc finger nucleotide-binding proteins with specificity for GNN triplet sequences, useful in gene therapy and for
